its expression, as if its power were lessened; but some planets, especially the malefics, seem to be made more malefic in quality, and not lessened in quantity of power at all.

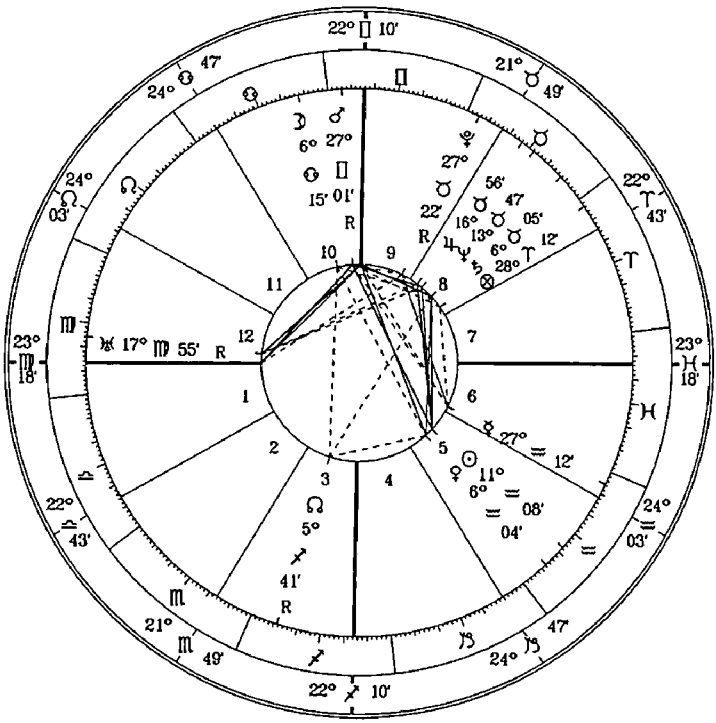
Similarly if a planet's sect is in accordance with the chart, its placement in the chart, and the sect of its sign, it is a quite powerful dignity which was called *Hayz, Haim,* or *Aym*,[1] all of which are Latin corruptions of the Arabic word *Hayyiz.* There was one curious exception to the definition of *Hayz,* however. Mars, while nocturnal in sect is and was considered masculine in sex. Mars was considered to be in *Hayz* only when it was in a nocturnal chart, above the horizon (nocturnally placed), in a *masculine* (diurnal) sign. The logic of sect suggests that this is a later change from an older doctrine in which Mars should have been in a nocturnal (feminine) sign. However, this has not yet been completely proved.

The opposite condition in which a planet is completely out of sect has no traditional name. However, it seems to be an important debility, especially for the malefics. Therefore I have taken the liberty of giving it a name derived from the Latin word for sect mentioned above, *condicio* or *conditio.* I prefer the second spelling of the word as it is more familiar to us through the English word 'condition'. I have simply translated the phrase 'out of sect' into Latin as *extra conditione.* The pronunciation can be considered close enough if it is pronounced exactly as written except that the 'e' at the end is *not* silent. Whenever the English word 'condition' by itself occurs in this text it should be understood in the conventional, general sense, not having any technical meaning with regard to sect.

One last basic matter pertaining to sect has to do with the phase of the Moon. The Moon is always at its root a nocturnal planet. However, according to Julius Firmicus Maternus, it is favorable applying to diurnal planets when it is waxing and unfavorable when applying to nocturnal planets. Similarly the waning Moon is favorable when applying to nocturnal planets and unfavorable when applying to diurnal planets. There is no one place in his writing where he states this principle, but one finds examples of it all over his work. It is as if he assumes that the reader is familiar with the idea. I have found this distinction between the applications of the waxing and waning Moon to be useful in my work.

[1] The 'm' at the end of the last two variants of the word may be a typographical misinterpretation. In Medieval calligraphy the terminal 'm' and the letter 'z' were nearly identical and easily confused.

A Sample Chart — FDR[1]



We present here a chart to illustrate the basic definitions of sect. We are

---

[1] The birth data are obtained from the Blackwell Data Base as follows: "1882, Jan. 30 at 8:45 p.m. L.M.T. (01:40:56 U.T., Jan. 31) in Springwood, near Hyde Park, NY (Hyde Park: 41N48, 73W56). Birth data of the U.S. president is from father's diary entry according to *The Roosevelts* by A. Churchill (F. Muller Ltd., London, 1966)."

This same information is repeated in a number of other biographical references as well.

All charts given in this book use the Koch house system. However, this has little effect upon the matters that we are discussing in this text.
